## BACKGROUND

- Instituting an “integrated comprehensive approach to transgender healthcare and human rights” as part of the New York Ending the HIV Epidemic Blueprint remains challenging partially due to underascertainment of transgender identity within healthcare and public health systems, the lack of integration of disparate data systems, and barriers to accessing affordable, non-stigmatizing healthcare.
- Matching Medicaid to HIV Registry data could address some of these gaps and lead to better health outcomes among transgender persons.

## OBJECTIVES

- Develop an algorithm to identify transgender persons in Medicaid claims data;
- Estimate the prevalence of HIV among transgender persons accessing Medicaid by matching to the HIV Registry; and
- Describe their socio-demographic characteristics.

## METHODS

- An algorithm was developed that combined transgender-related diagnosis codes, sex, prescription drugs, and transgender-related restriction and exception (R/E) codes (Validation Steps under Table 1) to identify transgender persons in Medicaid claims from 2013 to 2017.
- Individuals determined to be transgender in Medicaid were matched against the NYC HIV Registry to identify those with HIV, and the Registry was utilized to find additional transgender persons not identified by the algorithm.
- Numbers enrolled over time and socio-demographic characteristics were assessed descriptively from transgender persons’ Medicaid enrollment data.

## Results

- 6,335 unique transgender persons** accessing Medicaid in 2013-2017 were identified, 95% ascertained through the algorithm and 5% additionally identified through the Registry (Figure 1).
- 1764 (28%) were diagnosed with HIV.** 21% of transgender persons with HIV identified by the algorithm were misclassified as cisgender in the Registry. More PWH were older, resided in the Bronx, were Black, had male sex on their Medicaid card, were deceased, and had been enrolled longer in Medicaid than those not living with HIV (Table 2).
- The 6,335 were .1% of Medicaid enrollees and **over the 5 years there was a 35% increase in transgender enrollees (Figure 2). 79% of transgender persons in the Registry used Medicaid.**

TABLE 1: Criteria to identify transgender persons in Medicaid claims, NYC 2013-2017.

Validation Steps		Alternate Criteria Specific to Transgender Subpopulations	
<div>1. Diagnoses meeting the primary criterion standard were ICD-10 F64.0, F64.1, F64.2, F64.8, F64.9, F65.1, Z87.890 and ICD-9 302.3, 302.50, 302.51, 302.52, 302.53, 302.6, and 302.85. If a person had any of these diagnosis codes in 2013-2017 they were considered validated as transgender.</div> <div>2. Individuals not meeting the primary criterion, but who met any alternate criteria in Table 1 with an * were also validated.</div> <div>3. Those meeting alternate criteria without an * went through further validation, including assessing if they met more than 1 alternate criterion or individual review.</div>	Subgroup	Alternate Criteria <sup>a,b</sup>	
	Trans Men	Female + testosterone + Endocrine disorder unspecified diagnosis*	
		Male + testosterone + Endocrine disorder unspecified diagnosis	
	Trans Youth Taking Puberty Suppressants	G2 Female-to-Male restriction/exception code*	
		Puberty suppressant + age of 10-16 + no diagnosis of precocious puberty	
	Trans Women	Male + estrogen	
		Male + progestin	
		Male + Lupron + estrogen	
		estrogen	
		Female + 5-alpha reductase inhibitor + estrogen	
Male + spironolactone + estrogen*			
Male + flutamide + estrogen			
	G1 Male-to-Female restriction/exception code*		
<sup>a</sup> Sex was taken from the binary sex variable in Medicaid. Current gender identity is not available through Medicaid.			
<sup>b</sup> For any criterion that includes more than 1 drug, the drugs must have claims with the same date in Medicaid.			
*After matching to transgender-related diagnosis codes, no further validation done.			

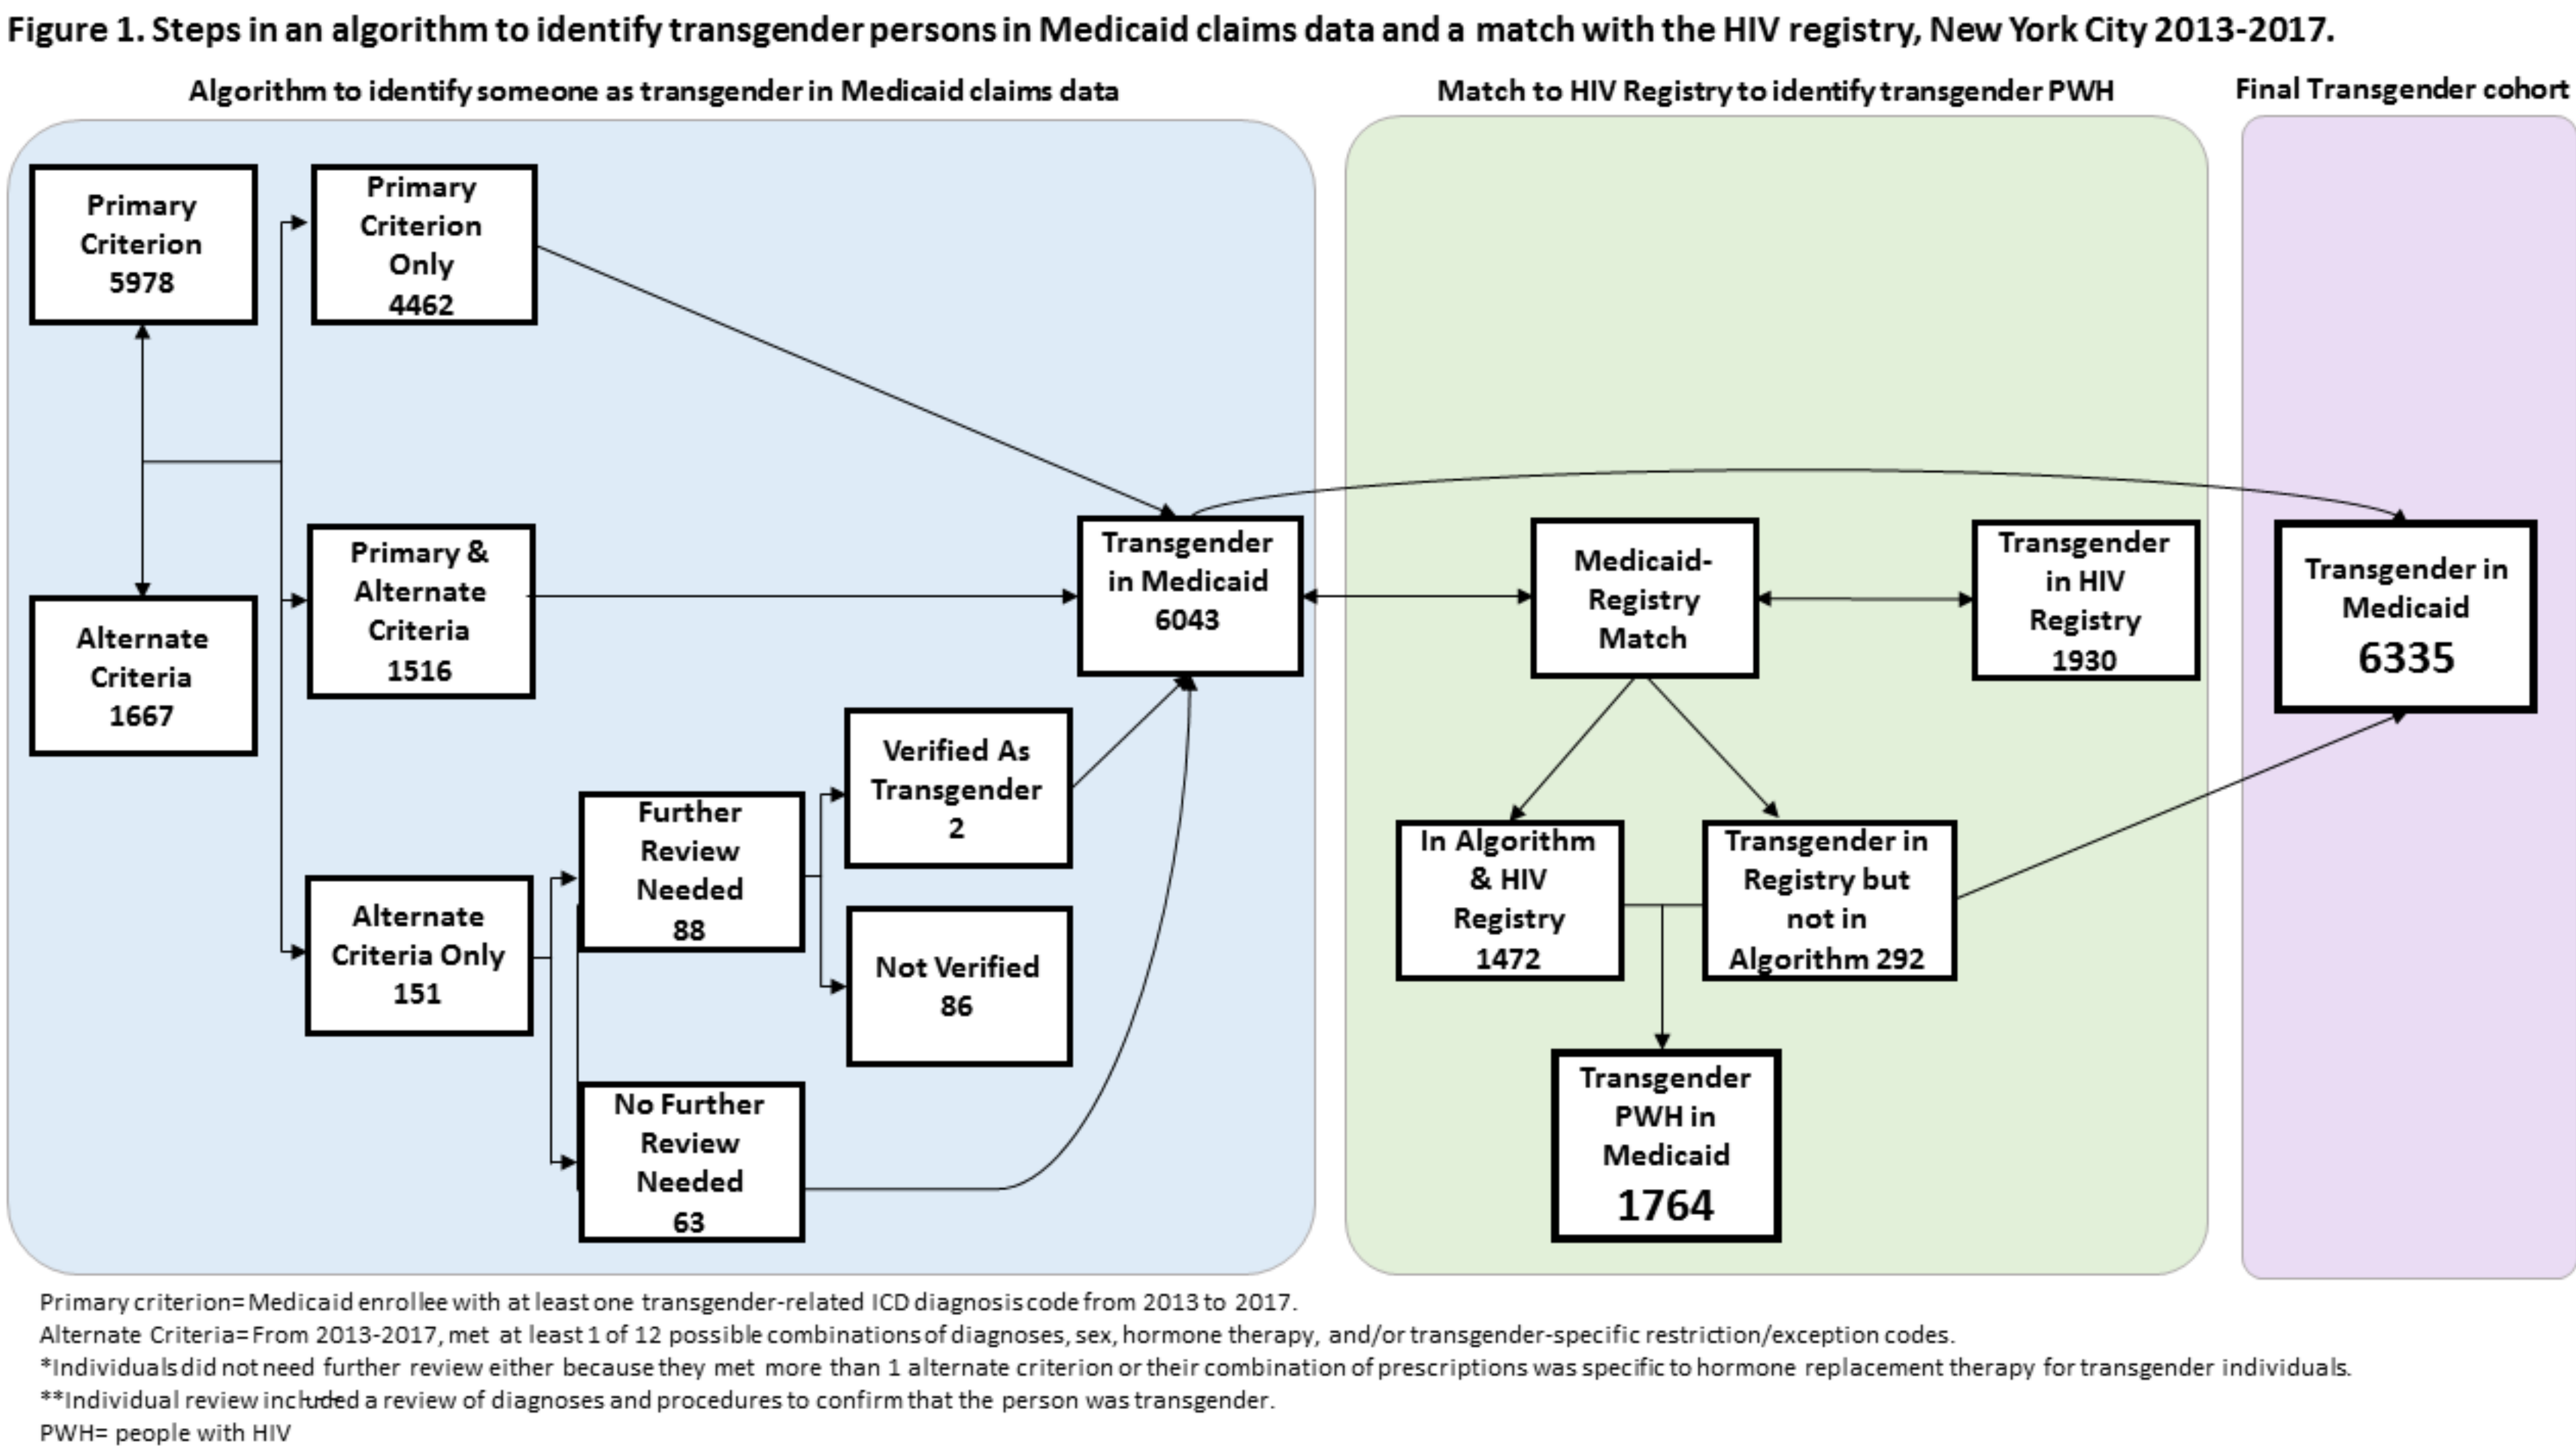

TABLE 2: Characteristics of transgender persons in Medicaid by HIV status, NYC 2013-2017.

Beneficiary Characteristics	Total		Non-PWH		PWH	
	N	%	N	%	N	%
TOTAL	6335	100.0	4571	100.0	1764	100.0
Age						
0 - 12	139	2.2	139	3.0	0	0.0
13 - 19	497	7.8	489	10.7	8	0.5
20 - 29	2279	36.0	1846	40.4	433	24.5
30 - 39	1563	24.7	988	21.6	575	32.6
40 - 49	840	13.3	466	10.2	374	21.2
50 - 59	662	10.4	366	8.0	296	16.8
60+	355	5.6	277	6.1	78	4.4
Borough

Male	3247	51.3	2128	46.6	1119	63.4
Alive or Dead						
Alive	6171	97.4	4493	98.3	1678	95.1
Dead	164	2.6	78	1.7	86	4.9
Also in Medicare						
Medicare	593	9.4	381	8.3	212	12.0
Not Medicare	5742	90.6	4190	91.7	1552	88.0
Enrollment Length in Months						
Median (IQR)	31 (10, 83)		26 (8, 66)		50 (16, 116)	

\*Estimates are based on a beneficiary's last enrollment record.

## TABLES AND FIGURES

FIGURE 1: Steps in an algorithm to identify transgender persons in Medicaid claims data and a match with the HIV registry, NYC 2013-2017.

In total 79% of transgender PWH in the HIV Registry were found to be in Medicaid; 1764 trans PWH in Medicaid/(1930 trans in Registry + 304 misclassified as cisgender in Registry).

FIGURE 2: Transgender persons enrolled in Medicaid by year, all enrollees and enrollees living with HIV, NYC 2013-2017

## CONCLUSION

We identified a large number of transgender persons accessing Medicaid in NYC, with that number increasing substantially in recent years. Almost 30% were diagnosed with HIV. This analysis highlights the value of combining Medicaid and HIV surveillance data in order to enable more holistic assessment of the health needs of transgender persons and that Medicaid is a critical safety net program for this population in NYC.
